

Pakrite
SILAGE WRAP

Pakrite Silage Wrap

3-layer co-extruded quality blown film

Pakrite is a multi-layer stretch film manufactured for wrapping conventional round bales with all type of bale wrappers. Pakrite offers superior strength and tack levels and has a constant high quality performance both during and after wrapping. The film is UV protected to ensure a long life of the film once applied.

For best quality results a **minimum of 6 layers** should be applied to all bales.

- Store the plastic film rolls in their original package in an upright position, in dry space and away from sunlight.
- The height of the pre-stretch unit has to be aligned with the center of the bale.
- Do not pre-stretch the film more than 70% and ensure at least 50% overlap. Do not wrap in rainy weather.
- Level the swath and do not wrap dump or dirty fodder. Bales should be dense and cylindrical in shape.
- Wrap immediately after baling and transport the bales to final storage area without delay.
- Sheltered space and sandy ground will help prevent damage caused by animals. Only an intact film guarantees the preservation of fodder.
